Results

Above are the results of the PINN. The error for recreating the full solution field is $\approx 5\%$, despite using only $N_u = 100$ data points. This shows the power of PINNs to learn solution fields from sparse measurements, even when some of the input parameters are unknown.

The three colourmaps show the PINN prediction, the exact solution from the numerical method and the relative error between these two fields. We can see that the errors are largest near $t = 0$ and $x = 0$, but that overall the agreement is very good.

On the colourmap, we can see three vertical white lines, which show the location in time of the three profile plots of u against x . The three heat profiles at these times are plotted against the exact solution found using numerical methods. The profiles can be seen to be in very good agreement, but show worse agreement.

Further Work

Congratulations, you have now trained your second physics-informed neural network!

This network contains a number of hyper-parameters that could be tuned to give better results. Various hyper-parameters include: - number of data training points N_u - number of collocation training points N_f - number of layers in the network - number of neurons per layer - weightings for the data and PDE loss terms in the loss function (currently we use $\text{loss} = \text{loss_PDE} + 5 * \text{loss_data}$) - initialisation value for k - optimisation

It is also possible to use different sampling techniques for training data points. We randomly select N_u data points, but alternative methods could be choosing only boundary points or choosing more points near the $t = 0$ boundary.

return [here](#) to try out some of these changes if you like, or [here](#) to alter optimization method used

14 Next Steps

Next we move on to a more complex example using the Navier Stokes Equation in the notebook linked below

[Navier-Stokes PINNs discovery of PDE's](#)
